Microbus ANPR cameras deployed into the Middle East

Microbus is pleased to report that a growing number of Middle East countries have adopted their ANPR camera technology for security and access control solutions. Recent trials have proved that the growing Rapier range of ANPR cameras is ideally suited to the harsh environmental conditions and challenging plate formats experienced in this part of the world.

Microbus Rapier 25 and 25+ ANPR cameras are now installed at Abu Dhabi airport as part of a large integrated parking solution and are also being used for monitoring traffic flow outside the terminal building. The Rapier 25+ has been used in selected locations to provide additional illumination. Rapier 25 has been built into pedestals at entry and exit points. The cameras have been successfully operating 24/7 in

high ambient heat and humidity conditions.

In Qatar, successful trials of the soon to be launched Rapier High Definition (HD) ANPR cameras have been completed. These trials tested the capability for capturing excellent images from the wide variety of licence plates that are in use within the GCC countries. The local Microbus Value Added Partner (VAP), Ideal Solutions, is now actively promoting the full range of Rapier ANPR cameras into security market opportunities.

High Definition ANPR provides greater resolution for plate details and a potential for a wider field of view. Microbus has developed a solution that provides excellent IR illumination to support this resolution and thereby ensures best operation both day and night.

In Saudi Arabia, Microbus's VAP, Developed Dimension Information Technology (DDIT), is actively promoting our ANPR cameras within Homeland Security and Access Control solutions throughout the Kingdom. They have already installed Rapier ANPR cameras and M-PC2 vehicle computers into a number of operational police and demonstration vehicles.
