## Microbus ANPR cameras get Stemmer Imaging distribution boost

Microbus and Stemmer Imaging have established a new two-way distribution agreement for Europe which will see the companies combine their core strengths to provide their OEM and System Integrator customers with a greater product offering.

Steve Walker, Divisional Managing Director at Microbus, said: "This new partnership combines our high quality ANPR and evidential video surveillance cameras with Stemmer's huge European distribution network in the Intelligent Transport Systems (ITS) and other key markets.

Stemmer Imaging are a respected provider of high resolution, high speed image processing solutions that we have chosen for integration into our new Rapier HD camera range. This partnership provides OEMs and software System Integrators access to off-the-shelf specialist cameras and IR lighting without having to undertake their own product development."

Access to the latest HD camera technology and Stemmer Imaging's extensive expertise in camera interfacing and image data transmission standards will now be an additional resource available to the Microbus product development team to deliver more cost effective and complete ANPR camera systems.

The Rapier range of cameras from Microbus is available for either fixed or mobile applications. High quality cameras, innovative InfraRed (IR) pulsed LED design and multiprocessor-control circuitry for ANPR are housed in rugged, custom-designed housings. Ideally suited to both day and night usage, the IR illumination and integrated optics produce clear licence plates images and remove headlight glare. Rapier's control protocol allows every parameter to be set, preset, recalled and adjusted remotely.
